# COB LC450210PCH 

CMOS LSI

## 1/8 to 1/16 Duty Dot Matrix LCD Controller Driver

ON Semiconductor ${ }^{\text {® }}$
http:/lonsemi.com

## Overview

The LC450210PCH is the $1 / 8$ to $1 / 16$ duty dot matrix LCD controller driver. By controlling this driver with a microcontroller, it is used in applications such as character display and simple graphic display etc. This driver can drive a LCD panel of up to 3,200 dots $(16 \times 16$ dot font: 1 -line display of up to 12 digits and 128 segments, $5 \times 7$ dot font: 2-line display of up to 40 digits). The operating temperature range is from -40 to $+105\left[{ }^{\circ} \mathrm{C}\right]$.

## Features

1. Selectable duty ratio by serial data: $1 / 8$ duty to $1 / 16$ duty

| $1 / 8$ duty: $8 \times 200=1,600$ dots | $1 / 11$ duty: $11 \times 200=2,200$ dots | $1 / 14$ duty: $14 \times 200=2,800$ dots |
| ---: | :--- | :--- |
| $1 / 9$ duty: $9 \times 200=1,800$ dots | $1 / 12$ duty: $12 \times 200=2,400$ dots | $1 / 15$ duty: $15 \times 200=3,000$ dots |
| $1 / 10$ duty: $10 \times 200=2,000$ dots | $1 / 13$ duty: $13 \times 200=2,600$ dots | $1 / 16$ duty: $16 \times 200=3,200$ dots |

2. Selectable LCD bias voltage ratio by serial data: $1 / 4$ bias or $1 / 5$ bias
3. Selectable inversion drive of LCD drive waveform by serial data: line inversion or frame inversion
4. Adjustable frame frequency of common and segment output waveforms and clock frequency of voltage booster by serial data, for preventing interference with the frequency of the backlight.
5. Selectable operation modes by serial data: power-saving mode (maintains display data),
the state of display (ON, all ON, all OFF, all forced OFF)
6. Built-in oscillator circuit (built-in resistor and capacitor for oscillation)
7. Selectable fundamental clock operating modes by serial data: internal oscillator operating mode or external clock operating mode
8. Input of serial data supports CCB * format (for 5 V and 3 V )
9. Selectable voltage range of power supply for logic block by setting REGE pad

$$
\begin{aligned}
(\mathrm{VDD}):+4.5 \mathrm{~V} \text { to }+5.5 \mathrm{~V} & (5 \mathrm{~V} \text { power supply }(\text { REGE }=\mathrm{VDD})) \\
+2.7 \mathrm{~V} \text { to }+3.6 \mathrm{~V} & (3 \mathrm{~V} \text { power supply }(\text { REGE }=\mathrm{VSS}))
\end{aligned}
$$

10. Built-in quadruple and quintuple voltage booster with discharge function

Base voltage of boosting $\left(\mathrm{V}_{\mathrm{BTI}} 2\right):+3.2 \mathrm{~V}$ (Typ.) ( 5 V power supply (REGE=VDD))
$\left(\mathrm{V}_{\mathrm{BII}} \mathrm{l}=\mathrm{V}_{\mathrm{BTI}} 2\right):+2.7 \mathrm{~V}$ to $\mathrm{V}_{\mathrm{DD}}[\mathrm{V}](3 \mathrm{~V}$ power supply $(\mathrm{REGE}=\mathrm{VSS}))$
11. Power supply for LCD driver block $\left(\mathrm{V}_{\mathrm{LCD}}\right):+16.0 \mathrm{~V}$ (Typ.) $\quad\left(\mathrm{V}_{\mathrm{DD}}=5 \mathrm{~V}\right.$, Quintuple voltage booster is used.)
$+16.5 \mathrm{~V} \quad\left(\mathrm{~V}_{\mathrm{DD}}=3.3 \mathrm{~V}\right.$, Quintuple voltage booster is used.)
+4.5 V to +16.5 V (range with external power supply)
Continued on next page.

## ORDERING INFORMATION

See detailed ordering and shipping information on page 53 of this data sheet.

Continued from preceding page.
12. Built-in contrast adjuster

$$
\begin{array}{rlrl}
\text { LCD drive bias voltage }\left(\mathrm{V}_{\mathrm{LCD}} 0\right): & +4.65 \mathrm{~V} \text { to }+13.5 \mathrm{~V} \text { (Typ. })\left(\mathrm{V} D^{2}=5 \mathrm{~V} \text {, Quintuple voltage booster is used. }\right) \\
& +4.65 \mathrm{~V} \text { to }+14.1 \mathrm{~V} \quad & \left(\mathrm{~V}_{\mathrm{DD}}=3.3 \mathrm{~V}, \text { Quintuple voltage booster is used. }\right) \\
& +4.65 \mathrm{~V} \text { to }+14.1 \mathrm{~V} \quad & \left(\mathrm{~V}_{\mathrm{LCD}}=16.5 \mathrm{~V} \text { with external power supply }\right)
\end{array}
$$

13. The initialization of this driver and the prevention of an unintended display are controllable by setting $\overline{\text { RES }}$ pad.
14. Wide range of operating temperature: -40 to $+105\left[{ }^{\circ} \mathrm{C}\right]$
15. CMOS process and chip with Au bumps

Correspondence of RAM and Segment Output Pad

## Transfer Format of Serial Data

This LSI has several internal registers. These internal registers are written by CCB interface. Structure of transfer bits consists of CCB address and instruction data. First 8 bits are CCB address. The subsequent bits are instruction data. The bit number of instruction data is different depending on an instruction, and these bits are from 16 bits to 272 bits.
The serial data is taken by the positive edge of the CL signal, which is latched by the negative edge of the CE signal. When the number of data in CE="High level" period is different from the defined number, LSI does not execute the instruction and holds the old state. For more information about the number of instruction data, refer to "Instruction Table".
(1) When CL is stopped at the low level

(2) When CL is stopped at the high level

- B0 to B3, A0 to A3 CCB address is " B 2 H "
- D0 to D271

Instruction data (from 16 bits to 272 bits)
Instruction Table

(Note.1) "Set of display method" instruction must be executed first. If voltage booster, contrast adjuster and LCD drive bias voltage generator are used, wait time shown from (1) to (3) is needed for stabilization of each circuit after having reset a system by $\overline{\text { RES }}=$ "Low level".
(Note.2) When power-saving mode is changed to normal mode (BU="1" to " 0 "), wait time shown from (1) to (3) is needed for stabilization of each circuit.
When normal mode is changed to power-saving mode ( $B U=$ " 0 " to " 1 "), secure a stop transition time (discharge time) more than 200 [msec].
(1) When voltage booster, contrast adjuster and LCD drive bias voltage generator are used (DBC=" 1 ", CTC0,CTC1=" 1,1 "), the stabilization time of these circuits is 200 [msec]. (2) When contrast adjuster and LCD drive bias voltage generator are used (DBC="0", CTC0,CTC1="1,1"), the stabilization time of these circuits is 20 [msec] (3) When LCD drive bias voltage generator is used ( $D B C=$ " 0 ", $C T C 0, C T C 1=" 0,1$ "), the stabilization time of this circuit is $20[\mathrm{msec}]$.

* Refer from [Fig.5] to [Fig.9].
(Note.3) When the number of instruction data which want to execute is different from the number of transferred instruction data, the transferred instruction data is ignored (Note.4) n=1 to 186, $\mathrm{n}+14=15$ to 200, $\mathrm{m}=1,9$ (Note.5) $n=1$ to $185, n+15=16$ to $200, m=1$

## Explanation of Instruction Data

## 1. "Set of display method" instruction

The display method is set by "Set of display method" instruction.
After having reset a system by $\overline{\mathrm{RES}}=$ "Low level", make sure to execute "Set of display method" first.

(1-1) OC $\cdots$ This is control data to set a fundamental clock operating mode.
Internal oscillator operating mode and external clock operating mode are set by this control data.
When the internal oscillator operating mode is set, clock generator begins to run after power-saving mode is canceled ( $\mathrm{BU}=$ " 0 ").

| OC | Fundamental clock operating mode | The state of OSCI |
| :---: | :---: | :---: |
| 0 | Internal oscillator operating mode | Make sure to connect OSCI to VSS. |
| 1 | External clock operating mode | Input the clock f.CK from 100 to $600[\mathrm{kHz}]$. |

(1-2) DBC $\cdots$ This is control data to set a state of voltage booster.
Run or Stop of voltage booster is set by this control data.
About the combination of $\mathrm{DBC}, \mathrm{CTC} 0$ and CTC 1 , refer to the following table.
(1-3) CTC0, CTC1 $\cdots$ These are control data to set a state of contrast adjuster and LCD drive bias voltage generator. Run or Stop of contrast adjuster and LCD drive bias voltage generator is set by these control data. About the combination of DBC, CTC0 and CTC1, refer to the following table.

| DBC | CTC0 | CTC1 | Voltage booster | Contrast adjuster | LCD drive bias voltage generator |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | Stop | Stop | Stop |
| 0 | 0 | 1 | Stop | Stop | Run |
| 0 | 1 | 0 | Stop | Run | Stop |
| 0 | 1 | 1 | Stop | Run | Run |
| 1 | 0 | 0 | Run | Stop | Stop |
| 1 | 0 | 1 | Run | Stop | Run |
| 1 | 1 | 0 | Run | Run | Stop |
| 1 | 1 | 1 | Run | Run | Run |

About the state of Voltage booster, VBTI1, VBTI2 and VLCD, refer to the following table.

| The state of voltage booster | The state of VBTI1 | The state of VBTI2 | The state of VLCD |
| :---: | :---: | :---: | :---: |
| Unused | Make sure to open VBTI1. | Make sure to open VBTI2. | Supply a voltage from 4.5 V to 16.5 V to VLCD from the outside. |
| Quadruple voltage booster is used. | < REGE=VDD > <br> Input the voltage from 4.5 V to $\mathrm{V}_{\mathrm{DD}}[\mathrm{V}]$ to VBTII. < REGE=VSS > <br> Connect VBTI1 to VBTI2. | < REGE=VDD > <br> VBTI2 outputs a base voltage for voltage booster. <br> < REGE=VSS > <br> Connect VBTI1 to VBTI2, and Input the voltage from 2.7 V to $\mathrm{V}_{\mathrm{DD}}[\mathrm{V}](\leq 3.6 \mathrm{~V})$ to VBTII. | VLCD outputs the $\left(V_{B T I} \times 4\right)$ voltage |
| Quintuple voltage booster is used. | < REGE=VDD > <br> Input the voltage from 4.5 V to $\mathrm{V}_{\mathrm{DD}}[\mathrm{V}]$ to VBTII. <br> < REGE=VSS > <br> Connect VBTI1 to VBTI2. | < REGE=VDD > <br> VBTI2 outputs a base voltage for voltage booster. <br> < REGE=VSS > <br> Connect VBTI1 to VBTI2, and Input the voltage from 2.7 V to $\mathrm{V}_{\mathrm{DD}}[\mathrm{V}](\leq 3.3 \mathrm{~V})$ to VBTII. | VLCD outputs the $\left(\mathrm{V}_{\mathrm{BTI}}{ }^{2} \times 5\right)$ voltage |

(Note.1) During (1) or (2) time, voltage booster stops forcibly and is the discharge state. In the discharge state, the electric potential of VLCD is same as VBTI1.
(1) The period of $\overline{\mathrm{RES}}=$ "Low level" (Regardless of the setting of voltage booster)
(2) $\mathrm{DBC}=$ " 1 " is set by "Set of display method" instruction, and power-saving mode ( $\mathrm{BU}=$ " 1 ") is set by "Control of display ON / OFF" instruction.
(Note.2) The peripheral circuit of VBTI1, VBTI2, CP1P, CP12N, CP2P, CP3P, CP34N, CP4P and VLCD is as follows. Only changing the connection of CP4P, a multiple of the voltage booster is selectable.
< 5V Power supply (REGE=VDD),
Quadruple voltage booster is used (DBC="1") >

< 5V Power supply (REGE=VDD),
Quintuple voltage boost is used (DBC=" 1 ") $>$

< 5V Power supply (REGE=VDD),
Voltage booster is not used (DBC="0") >

< 3V Power supply (REGE=VSS),
Quadruple voltage booster is used (DBC="1") >

< 3V Power supply (REGE=VSS),
Quintuple voltage boost is used (DBC="1") >

< 3V Power supply (REGE=VSS),
Voltage booster is not used (DBC="0") >

About the state of contrast adjuster, LCD drive bias voltage generator and the state from VLCD1 to VLCD4, refer to the following table.

| The state of contrast adjuster | The state of LCD drive bias voltage generator | The state of VLCD0 | The state from VLCD1 to VLCD4 |
| :---: | :---: | :---: | :---: |
| Unused | Unused | Input LCD drive bias voltage (High level) to VLCDO from the outside. | Input LCD drive bias voltage (Middle level) to pads from VLCD1 to VLCD4 from the outside. <br> (When $1 / 4$ bias is used, make sure to open VLCD3.) |
| Use | Unused | VLCDO outputs the LCD drive bias voltage (High level) set by "Set of display contrast" instruction (CT0 to CT5). Make sure to connect a capacitor between VLCD0 and VLCD5. | Input LCD drive bias voltage (Middle level) to pads from VLCD1 to VLCD4 from the outside. <br> (When $1 / 4$ bias is used, make sure to open VLCD3.) |
| Unused | Use | Input LCD drive bias voltage (High level) to VLCDO from the outside. | Pads from VLCD1 to VLCD4 outputs LCD drive bias voltage (Middle level). <br> Make sure to connect a capacitor between pads from VLCD1 to VLCD4 and VLCD5. <br> (When $1 / 4$ bias is used, make sure to open VLCD3.) |
| Use | Use | VLCDO outputs the LCD drive bias voltage (High level) set by "Set of display contrast" instruction (CT0 to CT5). Make sure to connect a capacitor between VLCD0 and VLCD5. | Pads from VLCD1 to VLCD4 outputs LCD drive bias voltage (Middle level). <br> Make sure to connect a capacitor between pads from VLCD1 to VLCD4 and VLCD5. <br> (When $1 / 4$ bias is used, make sure to open VLCD3.) |

(Note.1) During (1) or (2) or (3) time, contrast adjuster and LCD drive bias voltage generator stop forcibly, and are the discharge state. In the discharge state, the electric potential of VLCD0, VLCD1, VLCD2, VLCD3 and VLCD4 are same as VLCD5.
(1) The period of $\overline{\text { RES }}=$ "Low level" (Regardless of the setting of contrast adjuster and LCD drive bias voltage generator)
(2) CTC $0=$ " 1 " is set by "Set of display method" instruction, and power-saving mode ( $\mathrm{BU}=$ " 1 ") is set by "Control of display ON / OFF" instruction.
(3) $\mathrm{CTC} 1=$ " 1 " is set by "Set of display method" instruction, and power-saving mode ( $\mathrm{BU}=$ " 1 ") is set by "Control of display ON / OFF" instruction.
(Note.2) When $1 / 4$ bias is set ( $\mathrm{DR}=$ " 0 "), set a peripheral circuit from VLCD0 to VLCD5 as follows.
< Contrast adjuster and LCD drive bias voltage generator are used. (CTC0,CTC1="1,1") >

$V_{L C D} \leq V_{L C D}-2.4[\mathrm{~V}]$
< Contrast adjuster is used, and LCD drive bias voltage generator is not used. (CTC0,CTC1="1,0") >

$\mathrm{V}_{\mathrm{LCD}} 0 \leq \mathrm{V}_{\mathrm{LCD}}-2.4[\mathrm{~V}]$
< Contrast adjuster is not used, and LCD drive bias voltage generator is used. (CTC0,CTC1=" 0,1 ") >

< Contrast adjuster and LCD drive bias voltage generator are not used. (CTC0,CTC1="0,0") $>$

(Note.3) When $1 / 5$ bias is set ( $\mathrm{DR}=$ " 1 "), set a peripheral circuit from VLCD0 to VLCD5 as follows.

< Contrast adjuster is used, and LCD drive bias voltage generator is not used. (CTC0,CTC1="1,0") >

$\mathrm{V}_{\mathrm{LCD}} \leq \mathrm{V}_{\mathrm{LCD}}-2.4[\mathrm{~V}]$
< Contrast adjuster is not used, and LCD drive bias voltage generator is used. (CTC0,CTC1="0,1") >

< Contrast adjuster and LCD drive bias voltage generator are not used. (CTC0,CTC1="0,0") >

(1-4) DT0 to DT3 $\cdots$ These are control data to set duty from $1 / 8$ to $1 / 16$.
Duty from $1 / 8$ to $1 / 16$ is set by these control data.

| DT0 | DT1 | DT2 | DT3 | Duty | The state from COM1 to COM16 |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | Pads which output scan pulse |  | Pads which output pulse of display off |  |
|  |  |  |  |  | Normal scan CDIR = "0" | Reversed scan CDIR = "1" | Normal scan CDIR = "0" | Reversed scan CDIR = "1" |
| 0 | 0 | 0 | 0 | 1/8 duty | COM1 to COM8 | COM16 to COM9 | COM9 to COM16 | COM8 to COM1 |
| 1 | 0 | 0 | 0 | 1/9 duty | COM1 to COM9 | COM16 to COM8 | COM10 to COM16 | COM7 to COM1 |
| 0 | 1 | 0 | 0 | 1/10 duty | COM1 to COM10 | COM16 to COM7 | COM11 to COM16 | COM6 to COM1 |
| 1 | 1 | 0 | 0 | 1/11 duty | COM1 to COM11 | COM16 to COM6 | COM12 to COM16 | COM5 to COM1 |
| 0 | 0 | 1 | 0 | 1/12 duty | COM1 to COM12 | COM16 to COM5 | COM13 to COM16 | COM4 to COM1 |
| 1 | 0 | 1 | 0 | 1/13 duty | COM1 to COM13 | COM16 to COM4 | COM14 to COM16 | COM3 to COM1 |
| 0 | 1 | 1 | 0 | 1/14 duty | COM1 to COM14 | COM16 to COM3 | COM15, COM16 | COM2, COM1 |
| 1 | 1 | 1 | 0 | 1/15 duty | COM1 to COM15 | COM16 to COM2 | COM16 | COM1 |
| X | X | X | 1 | 1/16 duty | COM1 to COM16 | COM16 to COM1 | - | - |

$X$ : don't care
(1-5) DR $\cdots$ This is control data to set $1 / 4$ bias or $1 / 5$ bias. $1 / 4$ bias or $1 / 5$ bias is set by this control data.

| DR | Bias | VLCD1 voltage | VLCD2 voltage | VLCD3 voltage | VLCD4 voltage |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | $1 / 4$ bias | $3 / 4 \mathrm{~V}_{\mathrm{LCD}} 0$ | $2 / 4 \mathrm{~V}_{\mathrm{LCD}} 0$ | Make sure to open VLCD 3 | $1 / 4 \mathrm{~V}_{\mathrm{LCD}} 0$ |
| 1 | $1 / 5$ bias | $4 / 5 \mathrm{~V}_{\mathrm{LCD}} 0$ | $3 / 5 \mathrm{~V}_{\mathrm{LCD}}{ }^{0}$ | $2 / 5 \mathrm{~V}_{\mathrm{LCD}} 0$ | $1 / 5 \mathrm{~V}_{\mathrm{LCD}} 0$ |

(1-6) WVC $\cdots$ This is control data to set inversion drive of LCD drive waveform. Line inversion or frame inversion is set by this control data.

| WVC | LCD drive waveform |
| :---: | :---: |
| 0 | Line inversion |
| 1 | Frame inversion |

(1-7) CDIR $\cdots$ This is control data to set scan direction of common outputs.
Scan direction of common outputs is set by this control data.

| CDIR | Scan direction of common outputs |
| :---: | :---: |
| 0 | Normal scan $\quad(\mathrm{COM} 1 \rightarrow \mathrm{COM} 2 \rightarrow \mathrm{COM} 3 \rightarrow \cdots \cdots \rightarrow \mathrm{COM} 15 \rightarrow \mathrm{COM} 16)$ |
| 1 | Reversed scan $(\mathrm{COM} 16 \rightarrow \mathrm{COM} 15 \rightarrow \mathrm{COM} 14 \rightarrow \cdots \cdots \rightarrow \mathrm{COM} 2 \rightarrow \mathrm{COM} 1)$ |

(1-8) SDIR $\cdots$ This is control data to set a correspondence of a segment output and a column address of RAM. A correspondence of a segment output and a column address of RAM are set by this control data. Only just changing the setting of SDIR data does not change the display of LCD. When display data is written to RAM, column address of RAM is converted. Then display data is saved to there.

| SDIR | Correspondence of a segment output and a column address of RAM |
| :---: | :---: |
| 0 | Normal direction <br> (Column address "CRA0 to CRA7=00H, $01 \mathrm{H}, 02 \mathrm{H}, \rightarrow \mathrm{C} 5 \mathrm{H}, \mathrm{C} 6 \mathrm{H}, \mathrm{C} 7 \mathrm{H}$ " of RAM corresponds to segment output "S1, S2, S3, $\rightarrow$, S 198 , S199, S200".) |
| 1 | Reversed direction <br> (Column address "CRA0 to CRA7=00H, 01H, 02H, $\rightarrow$ C5H, C6H, C7H" of RAM corresponds to segment output "S200, S199, S198, $\rightarrow$, S3, S2, S1".) |

(1-9) DBF0 to DBF2 $\cdots$ These are control data to set clock frequency of voltage booster. A clock frequency of voltage booster is set by these control data.

| D256 | D257 | D258 | D259 | D260 | D261 | D262 | D263 | D264 | D265 | D266 | D267 | D268 | D269 | D270 | D271 |
| PNC | 0 | 1 | 0 | SC0 | SC1 | 0 | BU | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 |

(2-1) PNC $\cdots$ This is control data to set normal display or reversed display.
Normal display or reversed display is set by this control data. When a state of display is ON
(SC0, SC1="0, 0"), the setting of PNC becomes effective.

| PNC | Normal display or Reversed display | Display data Dn_m="0" | Display data Dn_m="1" |
| :---: | :---: | :---: | :---: |
| 0 | Normal display | OFF | ON |
| 1 | Reversed display | ON | OFF |

(Note.1) Display data "Dn_m" is from D1_1 to D200_16.
(2-2) SC0, SC1 $\cdots$ These are control data to set a state of display.
A state of display is set by these control data.

| SCO | SC1 | The state of display | The state of segment outputs | The state of common outputs |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | ON | Waveform corresponding to display data | Scan pulse |
| 1 | 0 | All OFF | OFF waveform | Scan pulse |
| 0 | 1 | All ON | ON waveform | Scan pulse |
| 1 | 1 | All forced OFF | V $_{\text {LCD }} 5$ level | V $_{\text {LCD }} 5$ level |

(2-3) BU $\cdots$ This is control data to set normal mode or power-saving mode.
Normal mode or power-saving mode (low current) is set by this control data.

| BU | Mode | The state of <br> common and <br> segment outputs | Voltage booster | Contrast adjuster | LCD drive bias <br> voltage generator | Internal oscillator <br> (Reception state of the external <br> clock) |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | Normal <br> mode | Normal display <br> operation | These circuits can run <br> (depend on the setting of DBC,CTC0 and CTC1). |  |  |  | Run <br> (The external clock reception is <br> possible) |
| 1 | Power-saving <br> mode | $V_{\text {LCD }}$ 5 level | Stop and <br> discharge <br> (Note.1) | Stop and <br> discharge <br> (Note.1) | Stop and <br> discharge <br> (Note.1) | Stop | (The external clock is not <br> received.) |

(Note.1) During (1) or (2) or (3) or (4) time, voltage booster, contrast adjuster and LCD drive bias voltage generator stop forcibly. And each circuit is the discharge state.
(1) The period of $\overline{\text { RES }}=$ "Low level" (Regardless of the setting of voltage booster, contrast adjuster or LCD drive bias voltage generator)
In the discharge state, the electric potential of VLCD is same as VBTI1. And the electric potential of VLCD0, VLCD1, VLCD2, VLCD3 and VLCD4 are same as VLCD5.
(2) $\mathrm{DBC}=$ " 1 " is set by "Set of display method" instruction, and power-saving mode ( $\mathrm{BU}=$ " 1 ") is set by "Control of display ON / OFF" instruction. In the discharge state, the electric potential of VLCD is same as VBTII.
(3) CTC $0=$ " 1 " is set by "Set of display method" instruction, and power-saving mode ( $\mathrm{BU}=$ " 1 ") is set by "Control of display ON / OFF" instruction. In the discharge state, the electric potential of VLCD0 is same as VLCD5.
(4) $\mathrm{CTC} 1=$ " 1 " is set by "Set of display method" instruction, and power-saving mode ( $\mathrm{BU}=$ " 1 ") is set by "Control of display ON / OFF" instruction. In the discharge state, the electric potential of VLCD1, VLCD2, VLCD3 and VLCD4 are same as VLCD5.
(Note.2) When the setting is changed from normal mode to power-saving mode (BU=" $0 " \rightarrow$ " 1 "), secure a stop transition time more than 200 [ msec ]. When the setting is changed from power-saving mode to normal mode (BU=" $1 " \rightarrow " 0 "$ ), a time shown from (1) to (3) is needed for stabilization of each circuit.
(Refer to [Fig.9])
(1) When voltage booster, contrast adjuster and LCD drive bias voltage generator are used ( $\mathrm{DBC}=$ " 1 ", CTC0,CTC1=" $1,1 ")$, the stabilization time of these circuits is 200 [ msec ].
(2) When contrast adjuster and LCD drive bias voltage generator are used ( $\mathrm{DBC}=$ " 0 ", $\mathrm{CTC} 0, \mathrm{CTC} 1=" 1,1$ "), the stabilization time of these circuits is 20 [ msec ].
(3) When LCD drive bias voltage generator is used ( $\mathrm{DBC}=" 0 ", \mathrm{CTC} 0, \mathrm{CTC} 1=" 0,1 "$ ), the stabilization time of this circuit is 20 [msec].

## 3. "Set of line address" instruction

A line address of RAM to specify a start display position is set by "Set of line address" instruction.

| Instruction data (16 bits) |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| D256 | D257 | D258 | D259 | D260 | D261 | D262 | D263 | D264 | D265 | D266 | D267 | D268 | D269 | D270 | D271 |
| LNAO | LNA1 | LNA2 | LNA3 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 1 |
| (LSB) |  |  | (MSB) |  |  |  |  |  |  |  |  |  |  |  |  |

(3-1) LNA0 to LNA3 $\cdots$ These are control data to set a line address of RAM.
A line address of RAM to specify a start display position is set by these control data.
(ex.1) When a line address is " 8 H ", the relation between the common output and RAM at the normal scan (CDIR="0") is as follows.

| Line address of RAM |  |  |  | A start display position |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| LNAO | LNA1 | LNA2 | LNA3 | 1/8 duty | 1/9 duty | 1/10 duty | 1/11 duty | 1/12 duty | 1/13 duty | 1/14 duty | 1/15 duty | 1/16 duty |
| 0 | 0 | 0 | 1 | COM1 | COM1 | COM1 | COM1 | COM1 | COM1 | COM1 | COM1 | COM1 |
| 1 | 0 | 0 | 1 | COM2 | COM2 | COM2 | COM2 | COM2 | COM2 | COM2 | COM2 | COM2 |

## 4. "Write display data to RAM ( $8 \times 15$ bits in a lump)" instruction

The page address and column address of RAM are set by the "Write display data to RAM ( $8 \times 15$ bits in a lump)" instruction. And the display data of " $8 \times 15$ bits ( 8 common outputs $\times 15$ segment outputs)" are written to the specified page address and column address of RAM in a lump by this instruction.

| Instruction data (144 bits) |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| D128 | D129 | D130 | D131 | D132 | $\ldots \ldots$. | D243 | D244 | D245 | D246 | D247 |  |  |
| Dn_m | Dn_m+1 | Dn_m+2 | Dn_m+3 | Dn_m+4 | $\ldots \ldots$. | Dn+14_m+3 | Dn+14_m+4 | Dn+14_m+5 | Dn+14_m+6 | Dn+14_m+7 |  |  |

(Note.1) $\mathrm{n}=1$ to $186, \mathrm{n}+14=15$ to $200, \mathrm{~m}=1,9$

| Instruction data (continuance) |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| D248 | D249 | D250 | D251 | D252 | D253 | D254 | D255 | D256 | D257 | D258 | D259 | D260 | D261 | D262 | D263 | D264 | D265 | D266 | D267 | D268 | D269 | D270 | D271 |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | CRA0 | CRA1 | CRA2 | CRA3 | CRA4 | CRA5 | CRA6 | CRA7 | PGA | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
|  |  |  |  |  |  |  |  | (LSB) |  |  |  |  |  |  | (MSB) |  |  |  |  |  |  |  |  |

(4-1) CRA0 to CRA7 $\cdots$ These are control data to set a column address of RAM.
The settable range of a column address from CRA0 to CRA7 is from 00 H to C 7 H .
When a column address is set more than BAH, display data is written from start position and the overflowed data from RAM is canceled.
(4-2) PGA $\cdots$ This is control data to set a page address of RAM.
(4-3) $\operatorname{Dn} \_\mathrm{m}, \mathrm{Dn} \_\mathrm{m}+1$ to $\mathrm{Dn}+14 \_\mathrm{m}+7 \cdots$ These are display data which are written to RAM.
A start position of writing to RAM is set by PGA and the data from CRA0 to CRA7.
(ex.1) When a page address PGA is set to 0 and a column address from CRA 0 to CRA7 is set to 00 H , the relation between instruction data and a direction of writing to RAM is as follows.

(ex.2) When a page address PGA is set to 1 and a column address from CRA0 to CRA7 is set to BAH, the relation between instruction data and a direction of writing to RAM is as follows.

## LC450210PCH

## 5. "Write display data to RAM ( $16 \times 16$ bits in a lump)" instruction

The page address and column address of RAM are set by the "Write display data to RAM ( $16 \times 16$ bits in a lump)" instruction. And the display data of " $16 \times 16$ bits ( 16 common outputs $\times 16$ segment outputs)" are written to the specified page address and column address of RAM in a lump by this instruction.

| Instruction data (272 bits) |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| D0 | D1 | D2 | D3 | D4 | $\cdots \cdots$ | D251 | D252 | D253 | D254 | D255 |  |
| Dn_m | Dn_m+1 | Dn_m+2 | Dn_m+3 | Dn_m+4 | $\cdots \cdots$ | Dn+15_m+11 | Dn+15_m+12 | Dn+15_m+13 | Dn+15_m+14 | Dn+15_m+15 |  |

(Note.1) $\mathrm{n}=1$ to $185, \mathrm{n}+15=16$ to 200, $\mathrm{m}=1$

(5-1) CRA0 to CRA7 $\cdots$ These are control data to set a column address of RAM.
The settable range of a column address from CRA0 to CRA7 is from 00 H to C 7 H .
When a column address is set more than B 9 H , display data is written from start position and the overflowed data from RAM is canceled.
(5-2) PGA $\cdots$ This is control data to set a page address of RAM.
When PGA is set to 1 , display data is written from start position and the overflowed data from RAM is canceled.
(5-3) $\operatorname{Dn} \_m, D n \_m+1$ to $\mathrm{Dn}+15 \_\mathrm{m}+15 \cdots$ These are display data which are written to RAM.
The start position of writing to RAM is set by PGA and the data from CRA0 to CRA7.
(ex.1) When a page address PGA is set to 0 and a column address from CRA0 to CRA7 is set to 04 H , the relation between instruction data and a direction of writing to RAM is as follows.

(ex.2) When a page address PGA is set to 1 and a column address from CRA0 to CRA7 is set to B9H, the relation between instruction data and a direction of writing to RAM is as follows.

## 6. "Set of display contrast" instruction

When contrast adjuster is used, LCD drive bias voltage $\mathrm{V}_{\mathrm{LCD}} 0$ (High level) is set by "Set of display contrast" instruction.

| Instruction data (16 bits) |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| D256 | D257 | D258 | D259 | D260 | D261 | D262 | D263 | D264 | D265 | D266 | D267 | D268 | D269 | D270 | D271 |
| Сто | CT1 | CT2 | CT3 | CT4 | CT5 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 1 | 0 |
| (LSB) (MSB) |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

(6-1) CT0 to CT5 $\cdots$ These are control data to set a display contrast.
LCD drive bias voltage $\mathrm{V}_{\mathrm{LCD}} 0$ (High level) is set by these control data.
Follow a condition of $\mathrm{V}_{\mathrm{LCD}} 0 \leq \mathrm{V}_{\mathrm{LCD}}-2.4[\mathrm{~V}]$. (Reference example: from (ex.1) to (ex.4))
(ex.1) $\underline{V B T I}^{1}=\mathrm{VBTI}^{2}=3.3 \mathrm{~V}$, REGE $=\mathrm{VSS}$,
Quintuple voltage booster and contrast adjuster are used.

(ex.3) V BTI $1=\mathrm{VBTI} 2=3.0 \mathrm{~V}, \mathrm{REGE}=\mathrm{VSS}$, Quintuple voltage booster and contrast adjuster are used.

(ex.2) $\mathrm{VBTI}^{1=5.0 \mathrm{~V}, \text { REGE }=\mathrm{VDD} \text {, }}$
$\underline{\mathrm{V}_{\mathrm{BTI}}} 2=3.2 \mathrm{~V}$ (Output, Typ.),
Quintuple voltage booster and contrast adjuster are used.

(ex.4) VBTI $1=5.0 \mathrm{~V}$, REGE $=V D D$, $\underline{\mathrm{V}}_{\mathrm{BTI}^{2}}=3.2 \mathrm{~V}$ (Output, Typ.), Quadruple voltage booster and contrast adjuster are used.

Step voltage of LCD drive bias $\mathrm{V}_{\mathrm{LCD}} 0$ (High level) (Step voltage width: 0.15 V (fixed))

| Step | CTO | CT1 | CT2 | CT3 | CT4 | CT5 | $V_{\text {LCD }} 0$ level (High level) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 14.10 V |

Segment driver output when all LCD segments are off

Segment driver output when LCD segment corresponding to COM1 is on

Segment driver output when LCD segment corresponding to COM2 is on

Segment driver output when LCD segment corresponding to COM1 and COM3 is on

Segment driver output when LCD segment corresponding to $\operatorname{COM}(n-1)$ is on

Segment driver output when LCD segment corresponding to $\operatorname{COM}(\mathrm{n})$ is on

Segment driver output when all LCD segments are on

$1 / n$ duty ( n is integer from 8 to 16 )
(Note.1) The duty and frame frequency "fo" are set by DT0, DT1, DT2, DT3, FC0, FC1, FC2 and FC3 in "Set of display method" instruction.

1/8 to 1/16 Duty, 1/4 bias, Frame inversion (DR="0", WVC="1", CDIR="0")

$1 / \mathrm{n}$ duty ( n is integer from 8 to 16 )
(Note.1) The duty and frame frequency "fo" are set by DT0, DT1, DT2, DT3, FC0, FC1, FC2 and FC3 in "Set of display method" instruction.

1/8 to 1/16 Duty, 1/5 bias, Frame inversion (DR="1", WVC="1", CDIR="0")

$1 / n$ duty ( n is integer from 8 to 16 )
(Note.1) The duty and frame frequency "fo" are set by DT0, DT1, DT2, DT3, FC0, FC1, FC2 and FC3 in "Set of display method" instruction.

## Caution About Using CE, CL, DI, $\overline{\text { RES }}$ and OSCI with 5V signal

When CE, CL, DI, $\overline{\text { RES }}$ and OSCI are input the 5 V signal, these input pads must be observed following points to prevent destruction.
(1) Supply VDD (power supply for logic block) before inputting 5 V signal to CE, CL, DI, $\overline{\mathrm{RES}}$ and OSCI.
(2) Input 0 V to $\mathrm{CE}, \mathrm{CL}, \mathrm{DI}, \overline{\mathrm{RES}}$ and OSCI before shutting down VDD (power supply for logic block).

## Peripheral Circuit of OSCI

(1) Internal oscillator operating mode ( $\mathrm{OC}=" 0$ ")

When internal oscillator operating mode is set, make sure to connect OSCI to VSS.

(2) External clock operating mode ( $\mathrm{OC}=" 1$ ")

When external clock operating mode is set, make sure to input the clock (fCK: 100 to $600[\mathrm{kHz}]$ ) to OSCI from the outside.

## Power Supply Sequence

The following sequence must be observed when power supply is supplied and shut down. (Refer from [Fig.5] to [Fig.8])

- When voltage booster is used
$<5 \mathrm{~V}$ power supply $\mathrm{REGE}=\mathrm{VDD}>$
(1) When power supply is supplied:

Supply VDD (power supply for logic block). $\rightarrow$
Input a base voltage for voltage booster to VBTI1 after wait time for inputting voltage $(\geq 0)$. Reset
cancellation with $\overline{\text { RES }}=$ "High level" (Reset pulse width $(\geq 1[\mathrm{msec}])$ ). $\rightarrow$
Wait time for inputting serial data ( $\geq 1[\mathrm{msec}]$ ). $\rightarrow$
Set DBC to 1 by "Set of display method" instruction.
(2) When power supply is shut down:

Set BU to 1 by "Control of display ON / OFF" instruction. $\rightarrow$
Wait for stop transition time of each circuit ( $\geq 200$ [msec]). Reset with $\overline{\text { RES }}=$ "Low level". $\rightarrow$
Stop inputting a base voltage for voltage booster to VBTI1. $\rightarrow$
Wait time for shutting down the power supply $(\geq 0) . \rightarrow$
Shut down VDD (power supply for logic block).
$<3 \mathrm{~V}$ power supply REGE=VSS $>$
(1) When power supply is supplied:

Supply VDD (power supply for logic block). $\rightarrow$
Input a base voltage for voltage booster to VBTI1 and VBTI2 after wait time for inputting voltage ( $\geq 0$ ).
Reset cancellation with $\overline{\mathrm{RES}}=$ "High level" (Reset pulse width ( $\geq 1[\mathrm{msec}])$ ). $\rightarrow$
Wait time for inputting serial data ( $\geq 1[\mathrm{msec}]$ ). $\rightarrow$
Set DBC to 1 by "Set of display method" instruction.
(2) When power supply is shut down:

Set BU to 1 by "Control of display ON / OFF" instruction. $\rightarrow$
Wait for stop transition time of each circuit ( $\geq 200$ [msec]). Reset with $\overline{\text { RES }}=$ "Low level". $\rightarrow$
Stop inputting a base voltage for voltage booster to VBTI1 and VBTI2. $\rightarrow$
Wait time for shutting down the power supply $(\geq 0) . \rightarrow$
Shut down VDD (power supply for logic block).

- When voltage booster is not used
(1) When power supply is supplied:

Supply VDD (power supply for logic block). $\rightarrow$
Reset cancellation with $\overline{\text { RES }}=$ "High level" (Reset pulse width $(\geq 1[\mathrm{msec}])$ ). $\rightarrow$
Wait time for supplying voltage and wait time for inputting serial data ( $\geq 1$ [msec]). $\rightarrow$
Supply VLCD (power supply for LCD driver block). $\rightarrow$
Set DBC to 0 by "Set of display method" instruction.
(2) When power supply is shut down:

Set BU to 1 by "Control of display ON / OFF" instruction. $\rightarrow$
Wait for stop transition time of each circuit $(\geq 200[\mathrm{msec}]) . \rightarrow$
Shut down VLCD (power supply for LCD driver block). $\rightarrow$
Wait time for a reset $(\geq 0) . \rightarrow$
Reset with $\overline{\text { RES }}=$ "Low level". $\rightarrow$
Wait time for shutting down the power supply $(\geq 0)$. $\rightarrow$
Shut down VDD (power supply for logic block).
(Note.1) Make sure to open VBTI1, VBTI2, CP1P, CP12N, CP2P, CP3P, CP34N and CP4P.

After the following page, examples of power supply sequence and set or cancel the power-saving mode during
supplying power.
(ex.1) Voltage booster, contrast adjuster and LCD drive bias voltage generator are used.

- Instruction
(1) "Set of display method" is executed. ( $\mathrm{DBC=}=1 ", \mathrm{CTC} 0, \mathrm{CTC}=" 1,1 ")$

Make sure to execute "Set of display method" first.
When external clock operating mode is set, make sure to set OC to 1 .
(2) "Set of display contrast" is executed.
(3) "Write display data to RAM ( $8 \times 15$ bits in a lump)" or "Write display data to RAM ( $16 \times 16$ bits in a lump)" is executed.
(4) "Set of line address" is executed.
(5) "Control of display ON / OFF" is executed. (SC0, SC1=" $0,0 ", \mathrm{BU}=" 0 ")$
(6) "Control of display ON / OFF" is executed. (SC0, SC1=" $1,1 ", \mathrm{BU}=" 1 ")$

- Constraint on the timing

Reset pulse width : twres $\geq 1$ [msec]
Wait time for inputting voltage $\quad: \mathrm{t} 2 \geq 0$
Wait time for inputting serial data

## System Reset

## 1. Reset function

This LSI can reset the system by $\overline{\text { RES }}$ pad.

## 2. State of each block during reset

## (1) CLOCK GENERATOR, TIMING GENERATOR

These circuits are initialized forcibly during reset ( $\overline{\mathrm{RES}}=$ "Low level").

## (2) INSTRUCTION REGISTER \& DECODER, CCB INTERFACE, SHIFT REGISTER

Contents of these circuits are initialized forcibly, and these circuits don't accept serial data during reset ( $\overline{\mathrm{RES}}$ ="Low level").

## (3) ADDRESS COUNTOR

Contents of this circuit are initialized forcibly during reset ( $\overline{\mathrm{RES}}=$ "Low level").
(4) DISPLAY DATA RAM

Contents of RAM are not affected by reset.
(5) LATCH

Contents of LATCH are not affected by reset.
(6) COMMON DRIVER, SEGMENT DRIVER

Common drivers and segment drivers output $\mathrm{V}_{\mathrm{LCD}}{ }^{5}$ level, the display of LCD is forced OFF during reset ( $\overline{\mathrm{RES}}=$ "Low level").

## (7) VOLTAGE BOOSTER

Voltage booster stops, and the electric potential of VLCD is same as VBTI1 during reset ( $\overline{\mathrm{RES}}=$ "Low level").
(8) CONTRAST ADJUSTER

Contrast adjuster stops, and the electric potential of VLCD0 is same as VLCD5 during reset ( $\overline{\text { RES }}=$ "Low level").

## (9) LCD DRIVE BIAS VOLTAGE GENERATOR

LCD drive bias voltage generator stops, and the electric potential of VLCD1, VLCD2, VLCD3 and VLCD4 are same as VLCD5 during reset ( $\overline{\mathrm{RES}}=$ "Low level").

## 3. The state of PAD during reset

| PAD | The state during reset |
| :--- | :--- |
| S1 to S200 | $\mathrm{V}_{\mathrm{LCD}}{ }^{5}$ |
| COM1 to COM16 | $\mathrm{V}_{\mathrm{LCD}}{ }^{5}$ |
| VLCD | $\mathrm{V}_{\mathrm{BTI}}{ }^{1}$ |
| VLCD0 | $\mathrm{V}_{\mathrm{LCD}}{ }^{5}$ |

| PAD | The state during reset |
| :--- | :--- |
| VLCD1 | $\mathrm{V}_{\mathrm{LCD}} 5$ |
| VLCD2 | $\mathrm{V}_{\mathrm{LCD}}{ }^{5}$ |
| VLCD3 | $\mathrm{V}_{\mathrm{LCD}}{ }^{5}$ |
| VLCD4 | $\mathrm{V}_{\mathrm{LCD}}{ }^{5}$ |

## Sample Circuits

Sample circuits are as follows.

|  | Duty | Bias | VDD | VLCD | Voltage booster | Contrast adjuster | LCD drive bias <br> voltage <br> generator |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Sample circuit (1) | $1 / 8$ to $1 / 16$ | $1 / 5$ | 5.0 V | VLCD is not supplied <br> from the outside. | Quintuple <br> voltage boost | Used | Used |
| Sample circuit (2) | $1 / 8$ to $1 / 16$ | $1 / 5$ | 5.0 V | VLCD is not supplied <br> from the outside. | Quadruple <br> voltage boost | Used | Used |
| Sample circuit (3) | $1 / 8$ to $1 / 16$ | $1 / 5$ | 3.0 V | VLCD is not supplied <br> from the outside. | Quintuple <br> voltage boost | Used | Used |
| Sample circuit (4) | $1 / 8$ to $1 / 16$ | $1 / 5$ | 5.0 V | VLCD is supplied from <br> the outside. <br> (16.5V) | Unused | Used | Used |
| Sample circuit (5) | $1 / 8$ to $1 / 16$ | $1 / 5$ | 5.0 V | VLCD is supplied from <br> the outside. <br> (16.5V) | Unused | Unused | Used |
| Sample circuit (6) | $1 / 8$ to $1 / 16$ | $1 / 5$ | 5.0 V | VLCD is supplied from <br> the outside. <br> $(16.5 \mathrm{~V})$ | Unused | Unused | Unused |

## Sample circuit (1)

1/8 to $1 / 16$ Duty, $1 / 5$ bias,
$\mathrm{V}_{\mathrm{DD}}=5.0 \mathrm{~V}, \mathrm{~V}_{\mathrm{BTI}}=5.0 \mathrm{~V}$,
Quintuple voltage booster, Contrast adjuster and LCD drive bias voltage generator are used.
(REGE=VDD, "Set of display method" instruction (DBC=" $1 ", \mathrm{CTC} 0, \mathrm{CTC} 1=" 1,1 ", \mathrm{DR}=" 1$ ") is executed.)

$1[\mu \mathrm{~F}] \leq \mathrm{Cvd} \leq 10[\mu \mathrm{~F}]$
$1[\mu \mathrm{~F}] \leq \mathrm{Cbt} \leq 10[\mu \mathrm{~F}]$
$1[\mu \mathrm{~F}] \leq \mathrm{C} 1 \leq 10[\mu \mathrm{~F}]$
$1[\mu \mathrm{~F}] \leq \mathrm{C} 2 \leq 10[\mu \mathrm{~F}]$
$1[\mu \mathrm{~F}] \leq \mathrm{C} 3 \leq 10[\mu \mathrm{~F}]$
$1[\mu \mathrm{~F}] \leq \mathrm{C} 4 \leq 10[\mu \mathrm{~F}]$
$1[\mu \mathrm{~F}] \leq \mathrm{Cvl} \leq 10[\mu \mathrm{~F}]$
$0.1[\mu \mathrm{~F}] \leq \mathrm{Cvm} \leq 0.47[\mu \mathrm{~F}]$
$4.5 \mathrm{~V} \leq \mathrm{V}_{\mathrm{BTI}} 1 \leq \mathrm{V}_{\mathrm{DD}} \leq 5.5 \mathrm{~V}$
$\mathrm{V}_{\mathrm{LCD}}=16.0 \mathrm{~V}$ [Typ.] $\left(=\mathrm{V}_{\mathrm{BTI}} 2 \times 5\right)$
(*1) When $1 / 4$ bias is set $(\mathrm{DR}=" 0$ "), make sure to open VLCD3.
(*2) When the internal oscillator operating mode is set ( $\mathrm{OC}=$ " 0 "), make sure to connect OSCI to VSS.
(*3) Make sure to open unused common and segment drivers.
(*4) When "VBTI $1>5.5 \mathrm{~V}$ " is assumed during discharge of capacitors for voltage booster, make sure to connect a zener diode " $D$ " between VBTI1 and VSS.

## Sample circuit (2)

1/8 to $1 / 16$ Duty, $1 / 5$ bias,
$\mathrm{V}_{\mathrm{DD}}=5.0 \mathrm{~V}, \mathrm{~V}_{\mathrm{BTI}}=5.0 \mathrm{~V}$,
Quadruple voltage booster, Contrast adjuster and LCD drive bias voltage generator are used.
(REGE=VDD, "Set of display method" instruction (DBC=" $1 ", \mathrm{CTC} 0, \mathrm{CTC} 1=" 1,1 ", \mathrm{DR}=" 1 ")$ is executed.)

$1[\mu \mathrm{~F}] \leq \mathrm{Cvd} \leq 10[\mu \mathrm{~F}]$
$1[\mu \mathrm{~F}] \leq \mathrm{Cbt} \leq 10[\mu \mathrm{~F}]$
$1[\mu \mathrm{~F}] \leq \mathrm{C} 1 \leq 10[\mu \mathrm{~F}]$
$1[\mu \mathrm{~F}] \leq \mathrm{C} 2 \leq 10[\mu \mathrm{~F}]$
$1[\mu \mathrm{~F}] \leq \mathrm{C} 3 \leq 10[\mu \mathrm{~F}]$
$1[\mu \mathrm{~F}] \leq \mathrm{Cvl} \leq 10[\mu \mathrm{~F}]$
$0.1[\mu \mathrm{~F}] \leq \mathrm{Cvm} \leq 0.47[\mu \mathrm{~F}]$
$4.5 \mathrm{~V} \leq \mathrm{V}_{\mathrm{BTI}} 1 \leq \mathrm{V}_{\mathrm{DD}} \leq 5.5 \mathrm{~V}$
$\mathrm{V}_{\mathrm{LCD}}=12.8 \mathrm{~V}[$ Typ. $]\left(=\mathrm{V}_{\mathrm{BTI}} 2 \times 4\right)$
(*1) When $1 / 4$ bias is set $(\mathrm{DR}=" 0 ")$, make sure to open VLCD3.
(*2) When the internal oscillator operating mode is set ( $\mathrm{OC}=" 0$ "), make sure to connect OSCI to VSS.
(*3) Make sure to open unused common and segment drivers.
(*4) When "VBTI $1>5.5 \mathrm{~V}$ " is assumed during discharge of capacitors for voltage booster, make sure to connect a zener diode " $D$ " between VBTI1 and VSS.

## Sample circuit (3)

1/8 to $1 / 16$ Duty, $1 / 5$ bias,
$\mathrm{V}_{\mathrm{DD}}=3.0 \mathrm{~V}, \mathrm{~V}_{\mathrm{BTI}}{ }^{1}=\mathrm{V}_{\mathrm{BTI}}{ }^{2}=3.0 \mathrm{~V}$,
Quintuple voltage booster, Contrast adjuster and LCD drive bias voltage generator are used.
(REGE=VSS, "Set of display method" instruction ( $\mathrm{DBC}=" 1 ", \mathrm{CTC} 0, \mathrm{CTC} 1=" 1,1 ", \mathrm{DR}=" 1 "$ ) is executed.)

$1[\mu \mathrm{~F}] \leq \mathrm{Cvd} \leq 10[\mu \mathrm{~F}]$
$1[\mu \mathrm{~F}] \leq \mathrm{Cbt} \leq 10[\mu \mathrm{~F}]$
$1[\mu \mathrm{~F}] \leq \mathrm{C} 1 \leq 10[\mu \mathrm{~F}]$
$1[\mu \mathrm{~F}] \leq \mathrm{C} 2 \leq 10[\mu \mathrm{~F}]$
$1[\mu \mathrm{~F}] \leq \mathrm{C} 3 \leq 10[\mu \mathrm{~F}]$
$1[\mu \mathrm{~F}] \leq \mathrm{C} 4 \leq 10[\mu \mathrm{~F}]$
$1[\mu \mathrm{~F}] \leq \mathrm{Cvl} \leq 10[\mu \mathrm{~F}]$
$0.1[\mu \mathrm{~F}] \leq \mathrm{Cvm} \leq 0.47[\mu \mathrm{~F}]$
$2.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{BTI}} 1=\mathrm{V}_{\mathrm{BTI}} 2 \leq \mathrm{V}_{\mathrm{DD}} \leq 3.3 \mathrm{~V}$
$\mathrm{V}_{\mathrm{LCD}}=15.0 \mathrm{~V}$ [Typ.] $\left(=\mathrm{V}_{\mathrm{BTI}} 2 \times 5\right)$
(*1) When $1 / 4$ bias is set $(\mathrm{DR}=" 0$ "), make sure to open VLCD3.
(*2) When the internal oscillator operating mode is set ( $\mathrm{OC}=$ " 0 "), make sure to connect OSCI to VSS.
(*3) Make sure to open unused common and segment drivers.
(*4) When "VBTI $1>3.6 \mathrm{~V}$ " is assumed during discharge of capacitors for voltage booster, make sure to connect a zener diode "D" between VBTI1 and VSS.

## Sample circuit (4)

1/8 to $1 / 16$ Duty, $1 / 5$ bias,
$\mathrm{V}_{\mathrm{DD}}=5.0 \mathrm{~V}, \mathrm{~V}_{\mathrm{LCD}}=16.5 \mathrm{~V}$ (Voltage booster is not used, and supply VLCD from the outside),
Contrast adjuster and LCD drive bias voltage generator are used.
(REGE $=\mathrm{VDD}$, "Set of display method" instruction ( $\mathrm{DBC}=" 0 ", \mathrm{CTC} 0, \mathrm{CTC} 1=" 1,1 ", \mathrm{DR}=" 1 "$ ) is executed.)

$1[\mu \mathrm{~F}] \leq \mathrm{Cvd} \leq 10[\mu \mathrm{~F}]$
$1[\mu \mathrm{~F}] \leq \mathrm{Cvl} \leq 10[\mu \mathrm{~F}]$
$0.1[\mu \mathrm{~F}] \leq \mathrm{Cvm} \leq 0.47[\mu \mathrm{~F}]$
$4.5 \mathrm{~V} \leq \mathrm{V}_{\mathrm{LCD}} \leq 16.5 \mathrm{~V}$
(*1) When $1 / 4$ bias is set $(\mathrm{DR}=" 0$ "), make sure to open VLCD3.
(*2) When the internal oscillator operating mode is set ( $\mathrm{OC}=" 0$ "), make sure to connect OSCI to VSS.
(*3) Make sure to open unused common and segment drivers.

## Sample circuit (5)

$1 / 8$ to $1 / 16$ Duty, $1 / 5$ bias,
$\mathrm{V}_{\mathrm{DD}}=5.0 \mathrm{~V}, \mathrm{~V}_{\mathrm{LCD}}=16.5 \mathrm{~V}$ (Voltage booster is not used, and supply VLCD from the outside),
Contrast adjuster is not used (Input the VLCD voltage to VLCD0 pad),
LCD drive bias voltage generator is used.
(REGE $=\mathrm{VDD}$, "Set of display method" instruction ( $\mathrm{DBC}=" 0$ ", $\mathrm{CTC} 0, \mathrm{CTC} 1=" 0,1 ", \mathrm{DR}=" 1$ ") is executed.)

$1[\mu \mathrm{~F}] \leq \mathrm{Cvd} \leq 10[\mu \mathrm{~F}]$
$1[\mu \mathrm{~F}] \leq \mathrm{Cvl} \leq 10[\mu \mathrm{~F}]$
$0.1[\mu \mathrm{~F}] \leq \mathrm{Cvm} \leq 0.47[\mu \mathrm{~F}]$
$4.5 \mathrm{~V} \leq \mathrm{V}_{\mathrm{LCD}} \leq 16.5 \mathrm{~V}$
$\mathrm{V}_{\mathrm{LCD}}{ }^{0}=\mathrm{V}_{\mathrm{LCD}}$
(*1) When $1 / 4$ bias is set $(\mathrm{DR}=" 0$ "), make sure to open VLCD3.
(*2) When the internal oscillator operating mode is set ( $\mathrm{OC}=$ " 0 "), make sure to connect OSCI to VSS.
(*3) Make sure to open unused common and segment drivers.

## Sample circuit (6)

$1 / 8$ to $1 / 16$ Duty, $1 / 5$ bias,
$\mathrm{V}_{\mathrm{DD}}=5.0 \mathrm{~V}, \mathrm{~V}_{\mathrm{LCD}}=16.5 \mathrm{~V}$ (Voltage booster is not used, and supply VLCD from the outside),
Contrast adjuster and LCD drive bias voltage generator are not used (Input the voltage to VLCD0, VLCD1, VLCD2, VLCD3 and VLCD4 from the outside.).
(REGE $=\mathrm{VDD}$, "Set of display method" instruction ( $\mathrm{DBC}=" 0$ ", $\mathrm{CTC} 0, \mathrm{CTC} 1=" 0,0 ", \mathrm{DR}=" 1$ ") is executed.)

## Caution

Caution is provided as follows for the stable operation of this LSI. However, caution does not provide any guarantee for operation and characteristics of this LSI.
Moreover, examples of application circuit described are used only to explain internal operation and usage of this LSI. Therefore, it is necessary to design an application or set, in consideration of an LCD specification and condition.

## (1) Power supply pads

All power supply pads must be connected to the power supply, and don't open.

## (2) ITO (Indium Tin Oxide) line

Wire the ITO line for power supply and voltage booster as short and wide as possible, because it is necessary to minimize the parasitic resistance of ITO line.

## (3) Signal wiring and connection

DUMMY pads should be opened.

## (4) Unused input pads

Unfixed input pads cause the unstable operation or the leak current of power supply, because this LSI adopts a CMOS process. Make sure to connect the open pad of logic input to VDD or VSS.

## (5) Protection from light

An exposure to the light may cause the malfunction of this LSI. Make sure to shut out the surface, side and back of this LSI from the light when this LSI is mounted to the product.

## PAD Assignment (Bump Side View)

- Chip size ( $\mathrm{X}, \mathrm{Y}$ and S are based on the dicing center.) $X=1.49 \mathrm{~mm} \quad \mathrm{Y}=10.63 \mathrm{~mm} \quad \mathrm{~S}=15.8387 \mathrm{~mm}^{2} \quad$ Chip thickness $=400 \mu \mathrm{~m}$
- Au bump (Typ.)

| Item | PAD No. | Bump shape | Size |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | X [ $\mu \mathrm{m}$ ] | Y [ $\mu \mathrm{m}$ ] | $\mathrm{S}\left[\mu \mathrm{m}^{2}\right]$ |
| Bump size | 1 to 202 | A | 170 | 27 | 4,590 |
|  | $\begin{aligned} & 203 \text { to } 210, \\ & 313 \text { to } 320 \end{aligned}$ | B | 45 | 99 | 4,455 |
|  | 211 to 312 | C | 68 | 65 | 4,420 |
| Min. bump pitch | 1 to 202 | A | 50 |  | - |
|  | $\begin{aligned} & 203 \text { to } 210, \\ & 313 \text { to } 320 \end{aligned}$ | B | 75 |  | - |
|  | 211 to 312 | C | 100 |  | - |
|  | 1 to 202 | A | 23 |  | - |
| Min. bump clearance | $\begin{aligned} & 203 \text { to } 210, \\ & 313 \text { to } 320 \end{aligned}$ | B | 30 |  | - |
|  | 211 to 312 | C | 35 |  | - |
| Bump height | All bumps |  | 17 |  | - |

- Alignment mark

Alignment mark 1

Alignment mark 2

Alignment mark 3

- Center coordinates of alignment marks

| Alignment mark | X coordinate $[\mu \mathrm{m}]$ | Y coordinate $[\mu \mathrm{m}]$ |
| :---: | :---: | :---: |
| Alignment mark 1 | -628 | -5110 |
| Alignment mark 2 | -628 | 5110 |
| Alignment mark 3 | 638 | -5070 |
